GBRA Re-Inflates Salt Water Barrier; Issues Boating Caution

FOR IMMEDIATE RELEASE, Thursday, June 15, 2006

Contact: Judy Gardner or Tammy Beutnagel at [830] 379-5822, jgardner@gbra.org or tbeutnagel@gbra.org.

SEGUIN- On Wednesday, June 14, the Guadalupe-Blanco River Authority (GBRA) reinflated the fabridam bags at the Lower Guadalupe Diversion Dam and Salt Water Barrier near Tivoli. The bags were briefly deflated earlier this month after runoff from local rainfall temporarily raised the level of the Guadalupe River.

“We are taking steps to protect local water supplies from salt water contamination as drought conditions trigger declining river flows and levels,” said Herb Wittlilff, manager of GBRA’s Calhoun County Operations. “Inflating both the inboard and outboard fabridam bags at the structure will prevent salt water from migrating upstream past the barrier and entering GBRA’s diversion system that delivers raw water from the Guadalupe River to municipal, industrial and agricultural users in Calhoun County.”

GBRA has also issued a boating caution for anyone who uses the lower Guadalupe River near Tivoli for water recreation or commercial fishing. Because a 2 to 4 foot drop in water level can occur from the upstream to the downstream side of the Salt Water Barrier when the bags are activated, warning signs will be posted and lights illuminated at night.

Attempting to pass through the structure in a boat while the barrier is in operation could result in serious injury, or possible loss of life. Boaters on the upstream side should stay a safe distance away from the structure to avoid being carried downstream by a strong current.

The Lower Guadalupe Diversion Dam and Salt Water Barrier was built in 1965 by GBRA and is located near Tivoli, about 10 miles upstream of the mouth of the Guadalupe River. The barrier is designed to allow river flows to pass through at all times. When the barrier is activated, upstream water pools to the top of the bags and then continues its normal flow over the bags and downstream. When not in operation, the fabridam bags are deflated and lie flat on the river bottom.

The barrier will remain in operation until river conditions improve. While GBRA is aware of the inconvenience to the boating public, operation of this structure is essential to safeguard water supplies for agricultural, industrial and municipal drinking water use. For more information, contact the GBRA Port Lavaca Water Treatment Plant at (361) 552-9751.
